

The goal is to create effective multi-media and show the effect of users' individual security practices on the organization's security posture as a whole.

It starts with having users self identify the need for this enhancement. This is done showcasing recent security concerns that have been presented, identifying the risk towards users themselves. As well as displaying the already collective quantitative data correlating human error and security breaches. Then, directing them to a form or other media to collect quantitative, reportable, data. Finally, analyzing and reporting on the collected data to suggest enhancements of cybersecurity education and application to enhance the organization's security posture.
